

Netville has extensive experience in development of applications for Android as well as in the Android system itself, and is a registered Android Developer and an Android Market partner.

## We can...

- Integrate Android in your mobile phones
- Develop Android device drivers for your specific hardware components
- Develop Android applications and related Internet services on your order, e.g. for gaming, advertising/marketing, productivity
- Integrate Mobile Labs' v-rocs and TAT's Cascades into Android and your mobile phones
- Port existing mobile applications (e.g. MIDlets) to Android on your request

## Android applications and services

Here are a few examples of applications and services Netville can develop on request.

### Gaming

The most popular mobile applications today are games, and such could be newly developed for Android or be converted from Java ME. Due to the advanced feature set of Android also more advanced games can be developed, including supporting full 3D graphics, use of accelerometer, GPS, etc. Netville can develop such stand-alone games as well as provide high-score services etc.

### Social networking

MySpace, Facebook, LinkedIn and similar services have become very popular and to many quite critical for everyday social interactions. As a mobile phone can take photos, record videos and audio, it's possible to go beyond basic text blogging and messaging. Netville can develop end-user applications for Android that interface with these or newly developed services.

### Corporate productivity

Almost all white collar and most blue collar workers have their own mobile phone at work, and it can be used for productivity-increasing functions like time and status reporting. As Android phones are advanced with typically both a touch-screen display and alphanumeric keypad, input and output is not limited to terse text messages or hard-to-discern images. Instead a full user interaction can be achieved, optionally utilizing the user's position, as well as photos and videos etc. Netville can develop such mobile applications as well as related services and service adaptations.

Android™ delivers a complete set of software for mobile devices: an operating system, middleware and key mobile applications.

# Why you should hire Netville for software projects

Netville adds competence and staff within application development, multimedia, user interface design, testing etc.

Our consultants are experts in developing applications for mobile platforms such as Android, Java ME, Symbian/Series 60, iPhone, Windows Mobile, and computer OS's such as Windows, Mac and Linux.

We have expertise in UI design, graphics (2D and 3D), CPU and memory efficient programming, algorithms, project management, release management, testing, documentation etc.

We can complement mobile application development with service ditto to build complete client/server solutions, using technologies and platforms like PHP, ASP.NET, MySQL, MS SQL, Javascript, AJAX etc.

We provide a testing facility for application compatibility with different mobile phones.

We lead and quality assure complete software development projects.

## Outsourcing

Projects can be completely outsourced to Netville. Advantages, among others:

- We take full responsibility from specification to final result
- Cost effective, as your office space, computers, software licenses, education and shared resources and related costs are not utilized
- Decreased load on your project and line management

## About Netville

Netville AB is located in Lund – Sweden's largest Telecom Center where also ST-Ericsson and Sony Ericsson Mobile Communications have their principal R&D units, and also close to Copenhagen where Nokia and other companies have development labs.

It was founded in 2003 with focus on software for Embedded Systems and Mobile Devices. It's an independent consulting company with specialist programmers. Netville has a long track record of projects within the telecom and embedded areas.

Netville consists of 30+ software developers with special competence in Embedded C, C++, C# and Java (server, desktop and mobile), and hardware related programming.

Customers include companies such as ST-Ericsson, Sony Ericsson, TAC, Sun Microsystems and TAT.
